

MageWell Recording Storage Guide

Purpose

This procedure outlines how to manage recordings from the Magewell device, including storing recordings on the file server, managing backup recordings on the USB drive, and understanding how the Magewell connects to the file server.

1. Primary Recording Method (File Server)

The primary method of recording is directly to the **file server**.

Recording Storage Location

1. Recordings are initially saved on the **V drive** in the following folder:

None

V:\Magewell Recording\

2. Inside this folder, locate:

REC_Folder

3. This folder contains the recordings that were just captured from the Magewell.

Moving Recordings to the Correct Location

1. Open the **REC_Folder**.
2. Locate the most recent recording file.
3. Move the file to the appropriate **Year Recorded Service folder** on the **V drive** i.e 2026 Services.

4. Confirm that the file:

- Was successfully moved.
- Opens and plays correctly.

Deleting the Original File

Once the recording has been verified:

1. Delete the original recording from the **REC_Folder**.
2. Do not keep duplicate copies of the same recording on the server.
This prevents unnecessary storage usage on the file server.

2. USB Recording Backup

The USB drive connected to the Magewell acts as a **backup recording location**.

USB Maintenance

The USB drive should be checked **approximately every two weeks**.

During this check:

1. Remove the USB drive.
2. Connect it to a computer.
3. **Format the drive** to erase any existing recordings.

Only **one format is required**. If formatted on a computer, no need to do it on the MageWell

3. Recovering Recordings from USB Backup

If a recording on the file server becomes corrupted:

1. Remove the **USB drive** from the Magewell device.
2. Insert the USB drive into a computer.
3. Locate the recording file on the USB drive.
4. Drag the recording file to the appropriate **Year Recorded Service folder** on the **V drive** and make sure the video will play.

This ensures the recording is still stored in the correct location.

4. Magewell Connection to File Server

The Magewell connects to the file server using the **Common Internet File System protocol**.

Protocol Used:

CIFS (Common Internet File System)

This allows the Magewell device to function as a **user on the file server** and store recordings directly on the V drive.

Login Credentials

The Magewell logs into the file server using the following account:

Username:

Video

Password:

streamER37

The Magewell CIFS configuration determines how the device connects to the file server.

Below is an example configuration screen and the meaning of each field.

WARNING
If the Network goes down for whatever reason, then you will need to reconfig the CIFS. It will not auto connect back to the network. Therefore if you do not do this then the recordings will not go to the file server

⏮ BACK

CONFIGURE NAS

Save recorded files to NAS(Network Attached Storage).

NAS type

CIFS - Common Internet File System

User name

Video

Password

.....

Host

192.168.20.18

Volume/Mount point

VIDEOS/Magewell Recordings

Clear

Save

Field explanations should include:

- **NAS Type:** CIFS Should be the one that is selected **NOT NFS**
- **Log in Information:**
 - **User Name:** Video
 - **Password:** streamER37
- **Host:** This is the IP address for the file server, **192.168.20.18**
- **Volume/Mount Point:** This is the folder path so the Magewell knows where to store the recordings. Must be the full name not the drive letter. **VIDEOS/Magewell Recordings**

WARNING

Any Changes done to that folder needs to be changed in the Magewell settings, like changing the name and location.

The Magewell recording determines how the MageWell will send the recording

Below is an example configuration screen and the meaning of each field.

RECORDING

Normal record mode will stop recording when the storage space is full.

Loop record mode provides continuously recording. Old files will be overwritten by new ones when the NAS is full.

Record mode	Normal
Stream	Main stream
Audio Stream	Audio stream 1
Video type	mp4
File path	REC_Folder
File name	Creation time
Duration	240 Minutes (14.28 GB)

Save

Field explanations should include:

- **Recording Mode:** This is if the recording will loop at the end or not.
 - **Normal**
- **Stream:** There are two types of recording main or sub, we do not use sub stream.
 - **Main Stream**
- **Audio Stream:** Same with the video, We do not use Sub stream but only the main.
 - **Audio stream 1**

- **Video Type:** This is what file extension you would like your recording to be save as
 - **MP4**
- **File Path:** Magewell will make a new folder inside of the folder that you told it to go to in the CIFS configuration.
 - **REC_Folder**

File Name: This is how the file will get named

- **Creation Time**
- **Durations:** This is how long before the clip just stops recording
 - **240 Minutes**
